

Package ‘iotables’

December 24, 2021

Type Package

Title Importing and Manipulating Symmetric Input-Output Tables

Date 2021-12-23

Version 0.4.8

Maintainer Daniel Antal <daniel.antal@dataobservatory.eu>

Description Pre-processing and basic analytical tasks related to working with Eurostat's symmetric input-output tables and provide basic input-output economics calculations. The package is part of rOpenGov <<http://ropengov.github.io/>> to open source open government initiatives.

<i>airpol_get</i>	<i>Get air pollutant data</i>
-------------------	-------------------------------

Description

Get air emissions accounts by NACE Rev. 2 activity for environmental impact assessments.

Usage

```
airpol_get(  
  airpol = "GHG",  
  geo = "BE",  
  year = 2020,  
  unit = "THS_T",  
  data_directory = NULL,  
  force_download = TRUE  
)
```

Arguments

- airpol** The code of the air pollutant. Defaults GHG, ACG, CH4, CH4_CO2E, CH4_NMVOCE, CO, CO2, CO2_BIO, CO_NMVOCE, GHG, HFC_CO2E, N2O, N2O_CO2E, NF3_SF6_CO2E, NH3, NH3_SO2E, NMVOC, NOX, NOX_NMVOCE, NOX_SO2E, O3PR, PFC_CO2E, PM10, PM2_5, SOX_SO2E.
- geo** The country code.
- year** The year. The average employment will be created for the given year, starting with 2008, when the NACE Rev 2 was introduced in employment statistics.
- unit** Defaults to "THS_T" (thousand tons.)
- data_directory** Defaults to NULL, if a valid directory, it will try to save the pre-processed data file here with labelling.
- force_download** Defaults to TRUE. If FALSE it will use the existing downloaded file in the *data_directory* or the temporary directory, if it exists.

Details

Currently works only with product x product tables. The dataset air emissions accounts by NACE Rev. 2 activity [*env_ac_ainah_r2*] has five dimensions: The Air pollutant *airpol* variables are collected on the emissions of the following pollutants: Carbon dioxide without emissions from biomass (CO2), Carbon dioxide from biomass (Biomass CO2), Nitrous oxide (N2O), Methane (CH4), Perfluorocarbons (PFCs), Hydrofluorocarbons (HFCs), Sulphur hexafluoride (SF6) including nitrogen

trifluoride (NF3), Nitrogen oxides (NOx), Non-methane volatile organic compounds, (NMVOC), Carbon monoxide (CO), Particulate matter smaller than 10 micrometre (PM10), Particulate matter smaller than 2,5 micrometre (PM2,5), Sulphur dioxide (SO2), Ammonia (NH3).

See [Reference Metadata in Euro SDMX Metadata Structure \(ESMS\)](#) for further details, particularly on the calculation of Global warming potential GHG, Acidifying gases ACG and Tropospheric ozone precursors O3PR.

Value

A data.frame with auxiliary metadata to conform the symmetric input-output tables.

Source

Eurostat folder [Air emissions accounts by NACE Rev. 2 activity](#)

See Also

Other import functions: [employment_get\(\)](#), [iotable_get\(\)](#), [iotables_download\(\)](#), [iotables_metadata_get\(\)](#), [iotables_read_tempdir\(\)](#)

Examples

```
airpol_get( airpol = "GHG", geo="BE", year = 2020, unit = "THS_T")
```

backward_linkages	<i>Backward linkages</i>
-------------------	--------------------------

Description

Indicate the interconnection of a particular sector to other sectors from which it purchases inputs (demand side). When a sector increases its output, it will increase the total (intermediate) demand on all other sectors, which is measured by backward linkages.

Usage

```
backward_linkages(Im)
```

Arguments

Im A Leontieff inverse matrix created by the [leontieff_inverse_create](#) function.

Details

Backward linkages as defined by the Eurostat Manual of Supply, Use and Input-Output Tables (see p506-507.)

Value

The vector of industry (product) backward linkages in a wide data.frame class, following the column names of the Leontieff inverse matrix.

See Also

Other linkage functions: [forward_linkages\(\)](#)

Examples

```
de_coeff <- input_coefficient_matrix_create( iotable_get(),
                                             digits = 4 )
I <- leontieff_inverse_create (de_coeff)
backward_linkages (I)
```

coefficient_matrix_create
Create a coefficient matrix

Description

Create a coefficient matrix from a Symmetric Input-Output Table.

Usage

```
coefficient_matrix_create(
  data_table,
  total = "output",
  digits = NULL,
  remove_empty = TRUE,
  households = FALSE,
  return_part = NULL
)
```

Arguments

data_table	A symmetric input-output table, a use table, a margins or tax table retrieved by the iotable_get function.
total	Usually an output vector with a key column, defaults to "output" which equals "P1" or "output_bp". You can use other rows for comparison, for example "TS_BP" if it exists in the matrix.
digits	An integer showing the precision of the technology matrix in digits. Default is NULL when no rounding is applied.
remove_empty	Defaults to TRUE. If you want to keep empty primary input rows, choose FALSE. Empty product/industry rows are always removed to avoid division by zero error in the analytic functions.
households	Defaults to NULL. Household column can be added with TRUE.
return_part	Defaults to NULL. You can choose "product" or "industry" to return an input coefficient matrix or "primary_inputs" to get only the total intermediate use and proportional primary inputs.

Details

The coefficient matrix is related by default to output, but you can change this to total supply or other total aggregate if it exists in your table.

Value

A data.frame that contains the matrix of `data_table` divided by `total` with a key column. Optionally the results are rounded to given digits.

References

See [United Kingdom Input-Output Analytical Tables 2010](#) for explanation on the use of the Coefficient matrix.

See Also

Other indicator functions: [direct_effects_create\(\)](#), [input_indicator_create\(\)](#)

Examples

```
coefficient_matrix_create(data_table = iotable_get(source = "germany_1990"),
                          total = "output",
                          digits = 4 )
```

conforming_vector_create

Create an empty conforming vector

Description

This helper function creates you a named vector that conforms your analytical objects, such as the use table, the Leontieff-matrix, etc. With 60x60 matrixes it is easy to make mistakes with manual definition. The empty effects vector can be used in .csv format as a sample to import scenarios from a spreadsheet application.

Usage

```
conforming_vector_create(data_table)
```

Arguments

`data_table` A use table, Leontieff-matrix, Leontieff-inverse, a coefficient matrix or other named matrix / vector.

Value

A wide-format conforming vector of data frame class, with column names matching the metadata of the `data_table`.

See Also

Other iotables processing functions: [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
de_input_flow <- input_flow_get(data_table = iotable_get())  
  
conforming_vector_create (data_table = de_input_flow)
```

croatia_2010_1700 *Input-output table for Croatia, 2010.*

Description

1700 - Symmetric input-output table at basic prices (product x product) In thousand kunas (T_NAC)

Usage

```
data(croatia_2010_1700)
```

Format

A data frame with 13 variables.

t_rows2 Technology codes in row names, following the Eurostat convention.

t_rows2_lab Longer labels for t_rows2

t_cols2 Technology codes in column names, following the Eurostat convention.

t_cols2_lab Longer labels for t_cols2

iotables_col The standardized iotables column labelling for easier reading.

col_order The column ordering to keep the matrix legible.

row_order The row ordering to keep the matrix legible.

iotables_row The standardized iotables row labelling for easier reading.

unit Different from Eurostat tables, in thousand national currency units.

geo ISO / Eurostat country code for Croatia

geo_lab ISO / Eurostat country name, Croatia.

time Date of the SIOT

values The actual values of the table in thousand kunas

Source

[Eurostat Manual of Supply, Use and Input-Output Tables](#) Updated 17 December 2015.

See Also

Other Croatia 2010 datasets: [croatia_2010_1800](#), [croatia_2010_1900](#), [croatia_employment_2013](#), [croatia_employment_aggregation](#), [primary_inputs](#)

croatia_2010_1800 *Input-output table for Croatia, 2010.*

Description

1800 - Symmetric input-output table for domestic production (product x product) In thousand kunas (T_NAC)

Usage

```
data(croatia_2010_1800)
```

Format

A data frame with 13 variables.

t_rows2 Technology codes in row names, following the Eurostat convention.

t_rows2_lab Longer labels for t_rows2

values The actual values of the table in thousand kunas

t_cols2 Column labels, following the Eurostat convention with differences. CPA_ suffix added to original DZS column names.

t_cols2_lab Longer labels for t_cols2

iotables_col The standardized iotables column labelling for easier reading.

col_order The column ordering to keep the matrix legible.

iotables_row The standardized iotables row labelling for easier reading.

row_order The row ordering to keep the matrix legible.

unit Different from Eurostat tables, in thousand national currency units.

geo ISO / Eurostat country code for Croatia

geo_lab ISO / Eurostat country name, Croatia.

time Date of the SIOT

Source

croatia_2010_1900 *Input-output table for Croatia, 2010.*

Description

1900 - Symmetric input-output table for imports (product x product) In thousand kunas (T_NAC)

Usage

```
data(croatia_2010_1900)
```

Format

A data frame with 13 variables.

t_rows2 Technology codes in row names, following the Eurostat convention.

t_rows2_lab Longer labels for t_rows2

values The actual values of the table in thousand kunas

t_cols2 Column labels, following the Eurostat convention with differences. CPA_ suffix added to original DZS column names.

t_cols2_lab Longer labels for t_cols2

iotables_col The standardized iotables column labelling for easier reading.

col_order The column ordering to keep the matrix legible.

iotables_row The standardized iotables row labelling for easier reading.

row_order The row ordering to keep the matrix legible.

unit Different from Eurostat tables, in thousand national currency units.

geo ISO / Eurostat country code for Croatia

geo_lab ISO / Eurostat country name, Croatia.

time Date of the SIOT

Source

[Eurostat Manual of Supply, Use and Input-Output Tables](#) Updated 17 December 2015.

See Also

Other Croatia 2010 datasets: [croatia_2010_1700](#), [croatia_2010_1800](#), [croatia_employment_2013](#), [croatia_employment_aggregation](#), [primary_inputs](#)

croatia_employment_2013

Croatian employment data for the year 2013

Description

Aggregate Croatian detailed employment statistics into the Croatian (EU standard) Symmetric input-output table format.

Usage

```
data(croatia_employment_2013)
```

Format

A data frame with 107 observations in 2 variables:

code Short labels

iotables_row iotables style labels

employment Employment in the sector in Croatia, not in thousands!

See Also

Other Croatia 2010 datasets: [croatia_2010_1700](#), [croatia_2010_1800](#), [croatia_2010_1900](#), [croatia_employment_aggregation](#), [primary_inputs](#)

croatia_employment_aggregation

Aggregation table for Croatian employment statistics

Description

Aggregate Croatian detailed employment statistics into the Croatian (EU standard) Symmetric input-output table format.

Usage

```
data(croatia_employment_aggregation)
```

Format

A data frame with 105 rows (including empty ones) and 2 variables.

employment_label Labelling in DZS English language export

t_cols2 Labelling of EU/DZS SIOTs.

See Also

Other Croatia 2010 datasets: [croatia_2010_1700](#), [croatia_2010_1800](#), [croatia_2010_1900](#), [croatia_employment_2013](#), [primary_inputs](#)

direct_effects_create *Create direct effects*

Description

The function creates the effects.

Usage

```
direct_effects_create(input_requirements, inverse, digits = NULL)
```

Arguments

`input_requirements` A matrix or vector created by [input_indicator_create](#)

`inverse` A Leontieff-inverse created by [leontieff_inverse_create](#).

`digits` Rounding digits, defaults to NULL, in which case no rounding takes place.

Value

A data.frame containing the direct effects and the necessary metadata to sort them or join them with other matrixes.

See Also

Other indicator functions: [coefficient_matrix_create\(\)](#), [input_indicator_create\(\)](#)

Examples

```
nl <- netherlands_2006

input_coeff_nl <- input_coefficient_matrix_create(
  data_table = netherlands_2006,
  households = FALSE)

compensation_indicator <- input_indicator_create(netherlands_2006, 'compensation_employees')

I_nl <- leontieff_inverse_create( input_coeff_nl )

direct_effects_create(input_requirements = compensation_indicator,
  inverse = I_nl)
```

employment_get	<i>Get employment data</i>
----------------	----------------------------

Description

Download the employment data for a country and arrange it to the 64x64 SIOTs.

Usage

```
employment_get(
  geo = "CZ",
  year = "2010",
  sex = "Total",
  age = "Y_GE15",
  labelling = "iotables",
  data_directory = NULL,
  force_download = TRUE
)
```

Arguments

geo	The country code.
year	The year. The average employment will be created for the given year, starting with 2008, when the NACE Rev 2 was introduced in employment statistics.
sex	Defaults to "Total". Enter "Females" or "F" for female employment, "Males" or "M" for male employment.
age	Defaults to "Y_GE15", which is the Eurostat code for employment in all age groups starting from 15-years-old. Any Eurostat code can be used as a parameter.
labelling	Either "iotables" or the applicable short code, for product x product SIOTs "prod_na" and in the case of industry x industry SIOTs "induse".
data_directory	Defaults to NULL, if a valid directory, it will try to save the pre-processed data file here with labelling.
force_download	Defaults to TRUE. If FALSE it will use the existing downloaded file in the data_directory or the temporary directory, if it exists.

Details

Currently works only with product x product tables.

Value

A data.frame with auxiliary metadata to conform the symmetric input-output tables.

Source

Eurostat statistic [Employment by sex, age and detailed economic activity \(from 2008 onwards, NACE Rev. 2 two digit level\) - 1 000](#)

See Also

Other import functions: [airpol_get\(\)](#), [iotable_get\(\)](#), [iotables_download\(\)](#), [iotables_metadata_get\(\)](#), [iotables_read_tempdir\(\)](#)

Examples

```
## Not run:
io_tables <- get_employment (
  geo = "CZ",
  year = "2010",
  sex = "Total",
  age = "Y_GE15",
  data_directory = NULL,
  force_download = TRUE
)

## End(Not run)
```

employment_metadata *Employment metadata*

Description

An arrangement of the Eurostat national accounts vocabulary to match with employment statistics data.

Usage

```
data(metadata)
```

Format

A data frame with 6 variables.

emp_code code used in the employment statistics

code Eurostat labels for SIOTs corresponding to emp_code

label Eurostat label descriptions for SIOTs corresponding to emp_code

variable Eurostat vocabulary source, i.e. t_rows, t_cols, prod_na, induse

group Different from Eurostat tables, in thousand national currency units.

iotables_label Custom, machine_readable snake format variable names

See Also

Other Metadata datasets: [metadata_uk_2010](#), [metadata](#)

empty_remove	<i>Symmetrically remove empty rows and columns</i>
--------------	--

Description

Symmetrically remove columns with only zero values or with missing values.

Usage

```
empty_remove(data_table)
```

Arguments

data_table	A symmetric input-output table, or a symmetric part of a use table or a supply table.
------------	---

Value

A tibble/data.frame with a key row and a symmetric matrix, after removing all empty columns and rows at the same time.

Examples

```
test_table <- input_coefficient_matrix_create(iotable_get(source = "germany_1990"))
test_table[, 2] <- 0
empty_remove (test_table)
```

equation_solve	<i>Solve a basic (matrix) equation</i>
----------------	--

Description

The function matches to parts of the matrix equation, using the named formats with row names and solves the matrix equation.

Usage

```
equation_solve(LHS = NULL, Im = NULL)
```

Arguments

LHS	A left-hand side vector with a key column containing the industry or product names for matching, for example the employment coefficients.
Im	A Leontieff-inverse with a key column containing the industry or product names for matching.

Details

This function is used in wrapper functions, such as [multiplier_create](#). to solve particular problems, but it can be used directly, too. The function only performs the lhs pairing industries and checking for exceptions.

Value

A data.frame with auxiliary metadata to conform the symmetric input-output tables.

Examples

```
Im = data.frame (
  a = c("row1", "row2"),
  b = c(1,1),
  c = c(2,0))
LHS = data.frame (
  a = "lhs",
  b = 1,
  c = 0.5)
equation_solve (Im = Im, LHS = LHS)
```

forward_linkages	<i>Forward linkages</i>
------------------	-------------------------

Description

The increased output of a sector indicates that additional amounts of products are available to be used as inputs by other sectors which can increase their production, which is captured in this indicator vector.

Usage

```
forward_linkages(output_coefficient_matrix, digits = NULL)
```

Arguments

output_coefficient_matrix	An output coefficient matrix created with the output_coefficient_matrix_create function.
digits	Number of decimals for rounding, defaults to NULL.

Details

Forward linkages as defined by the Eurostat Manual of Supply, Use and Input-Output Tables (see p506-507.)

Value

The vector of industry (product) forward linkages in a long-form data.frame, containing the meta-data column of the the row names from the output_coefficient_matrix.

See Also

Other linkage functions: [backward_linkages\(\)](#)

Examples

```
data_table = iotable_get()

de_out <- output_coefficient_matrix_create (
  data_table, "tfu", digits = 4
)

forward_linkages(output_coefficient_matrix = de_out,
  digits = 4 )
```

germany_1990	<i>Simple input-output table for Germany, 1990. For testing purposes a well documented example data set is used from the Eurostat manual. The table in the Eurostat manual is brought to the format used by the Eurostat database. It is a small dataset for examples, but it is also instructive to understand how Eurostat stores the highly structured SIOTs in long-form tidy datasets. The labels were slightly altered to reflect the transition from the vocabulary of ESA95 to ESA2010 since the publication of the Manual.</i>
--------------	---

Description

Simple input-output table for Germany, 1990.

For testing purposes a well documented example data set is used from the Eurostat manual. The table in the Eurostat manual is brought to the format used by the Eurostat database. It is a small dataset for examples, but it is also instructive to understand how Eurostat stores the highly structured SIOTs in long-form tidy datasets. The labels were slightly altered to reflect the transition from the vocabulary of ESA95 to ESA2010 since the publication of the Manual.

Usage

```
data(germany_1990)
```

Format

A data frame with 228 observations and 10 variables.

prod_na Technology codes in row names, following the Eurostat convention.

prod_na_lab Longer labels for t_rows2

induse Column labels, following the Eurostat convention with differences.

iotables_row Row labels, i.e. to be used in key column, for iotables package abbreviations

iotables_col Column labels for iotables package abbreviations

values The actual values of the table in million euros

unit MIO_EUR, the same as Eurostat

unit_lab Million euros. Eurostat usually has euro and national currency unit values, too.

geo ISO / Eurostat country code for Germany, i.e. DE

geo_lab ISO / Eurostat country name, Germany

time Date of the SIOT

Source

[Eurostat Manual of Supply, Use and Input-Output Tables](#) p 482

See Also

Other Validation datasets: [germany_airpol](#), [netherlands_2006](#), [uk_2010_data](#), [uk_test_results](#)

germany_airpol

Air Pollution Table for Germany, 1995.

Description

Air pollution values for validation.

Usage

```
data(germany_airpol)
```

Format

A data frame with 72 observations and 4 variables.

airpol The abbreviation of the air pollutant.

induse Column labels, following the Eurostat convention with differences.

iotables_col Column labels for iotables package abbreviations.

values The actual values of the table in thousand tons.

Details

For testing purposes and cross-checking with the Eurostat manual. The labels were slightly altered to reflect the transition from the vocabulary of ESA95 to ESA2010 since the publication of the Manual.

Source

[Eurostat Manual of Supply, Use and Input-Output Tables](#) p 482.

See Also

Other Validation datasets: [germany_1990](#), [netherlands_2006](#), [uk_2010_data](#), [uk_test_results](#)

household_column_find *Return the position of final household expenditure*

Description

Return the position of final household expenditure

Usage

```
household_column_find(data_table)
```

Arguments

data_table A symmetric input output table, a use table or a supply table.

Value

An integer value with the final household expenditure. Returns NULL if not found.

Examples

```
household_column_find( iotable_get ( source = 'germany_1990' ) )
```

household_column_get *Return Final Household Expenditure*

Description

Return Final Household Expenditure

Usage

```
household_column_get(data_table)
```

Arguments

data_table A symmetric input output table, a use table or a supply table.

Value

The column containing final household expenditure. If not found NULL is returned.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
household_column_get(iotable_get (source = 'germany_1990'))
```

indirect_effects_create
Create indirect effects

Description

The function creates the indirect effects vector.

Usage

```
indirect_effects_create(input_requirements, inverse, digits = NULL)
```

Arguments

`input_requirements` A matrix or vector created by [input_indicator_create](#)
`inverse` A Leontieff-inverse created by [leontieff_inverse_create](#).
`digits` Rounding digits, defaults to NULL, in which case no rounding takes place.

Value

A data.frame containing the indirect effects and the necessary metadata to sort them or join them with other matrixes.

Examples

```
nl <- netherlands_2006

input_coeff_nl <- input_coefficient_matrix_create(
  data_table = netherlands_2006,
  households = FALSE)

compensation_indicator <- input_indicator_create(netherlands_2006, 'compensation_employees')

I_nl <- leontieff_inverse_create(input_coeff_nl)

direct_effects_create(input_requirements = compensation_indicator,
  inverse = I_nl)
```

input_coefficient_matrix_create
Create an input coefficient matrix

Description

Create an input coefficient matrix from the input flow matrix and the output vector. The two input vectors must have consistent labelling, i.e the same column names must be found in the use table (input flow) and the output vector.

Usage

```
input_coefficient_matrix_create(data_table, households = FALSE, digits = NULL)
```

Arguments

data_table	A symmetric input-output table, a use table, a margins or tax table retrieved by the iotable_get function.
households	Defaults to NULL. Household column can be added with TRUE.
digits	An integer showing the precision of the technology matrix in digits. Default is NULL when no rounding is applied.

Details

The terminology follows the [Eurostat Manual of Supply, Use and Input-Output Tables](#). Input-Output Multipliers Specification Sheet and Supporting Material, Spicosa Project Report, which cannot be linked due to a malformed url, but can be found with a search engine. this matrix is called 'technological coefficients'. The results of the function are tested on both sources. This is a wrapper function around [coefficient_matrix_create](#).

Value

A data frame that contains the matrix of first quadrant of the use table as input_flow divided by output supported by a key column of product or industries, with a key column. Optionally the results are rounded to given digits.

An input coefficient matrix of data.frame class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

Examples

```
input_coefficient_matrix_create (
  iotable_get(),
  digits = 4 )

#This is a wrapper function and equivalent to

coefficient_matrix_create( iotable_get(),
  total = "total",
  return = "products")
```

input_flow_get	<i>Create a use (input flow) matrix</i>
----------------	---

Description

Select the use table from a symmetric input-output table.

Usage

```
input_flow_get(data_table, empty_remove = FALSE, households = TRUE)
```

Arguments

data_table	A symmetric input-output table or use table retrieved by the iotable_get function.
empty_remove	Defaults to TRUE. If you want to keep empty primary input rows, choose FALSE. Empty product/industry rows are always removed to avoid division by zero error in the analytic functions.
households	Defaults to FALSE. If TRUE, the final household expenditure is added to the input flow table.

Value

A data flow matrix (a symmetric use table) with a key column.

See Also

Other analytic object functions: [leontieff_inverse_create\(\)](#), [leontieff_matrix_create\(\)](#)

Examples

```
input_flow <- input_flow_get(data_table = iotable_get(),
                             empty_remove = FALSE,
                             households = TRUE)
```

input_indicator_create

Create input indicator(s)

Description

The function creates the input indicators from the inputs and the outputs.

Usage

```
input_indicator_create(
  data_table,
  input_row = c("gva_bp", "net_tax_production"),
  digits = NULL,
  households = FALSE,
  indicator_names = NULL
)
```

Arguments

data_table	A symmetric input-output table, a use table, a margins or tax table retrieved by the iotable_get function.
input_row	The name of input(s) for which you want to create the indicator(s). Must be present in the data_table. Use this if the input rows are not given in a separate variable, therefore input_vector=NULL.
digits	Rounding digits, if omitted, no rounding takes place.

households	If the households column should be added, defaults to FALSE.
indicator_names	The names of new indicators. Defaults to NULL when the names in the key column of input_matrix will be used to create the indicator names.
input_vector	Input vector(s) in a conforming format with the data_table. Defaults to NULL.

Value

A tibble (data frame) containing input_matrix divided by the output_vector with a key column for products or industries.

See Also

Other indicator functions: [coefficient_matrix_create\(\)](#), [direct_effects_create\(\)](#)

Examples

```
input_indicator_create( data_table = iotable_get(),
  input_row = c("gva", "compensation_employees"),
  input_vector = NULL,
  digits = 4,
  indicator_names = c("GVA indicator", "Income indicator"))
```

input_multipliers_create

Create input multipliers The function creates the multipliers (direct + indirect effects).

Description

Create input multipliers

The function creates the multipliers (direct + indirect effects).

Usage

```
input_multipliers_create(
  input_requirements,
  Im,
  multiplier_name = NULL,
  digits = NULL
)
```

Arguments

input_requirements	A matrix or vector created by input_indicator_create
Im	A Leontieff-inverse created by leontieff_inverse_create .
digits	Rounding digits, defaults to NULL, in which case no rounding takes place. Rounding is important if you replicate examples from the literature, rounding differences can add up to visible differences in matrix equations.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other multiplier functions: [multiplier_create\(\)](#)

Examples

```
nl <- netherlands_2006

input_coeff_nl <- input_coefficient_matrix_create(
  data_table = netherlands_2006,
  households = FALSE)

compensation_indicator <- input_indicator_create(netherlands_2006, 'compensation_employees')

I_nl <- leontieff_inverse_create(input_coeff_nl)

input_multipliers_create(input_requirements = compensation_indicator,
  Im = I_nl)
```

iotables

iotables

Description

Pre-processing and basic analytic tasks related to working with Eurostat's symmetric input-output tables and provide basic input-output economics calculations. The package is a part of rOpenGov <<http://ropengov.github.io/>> for open source open government initiatives.

import functions

The *iotables* import function help downloading and pre-processing the Eurostat symmetric input-output tables and related tables.

[iotable_get](#) returns a single table. [iotables_read_tempdir](#) reads data from the temporary directory of a session. [employment_get](#) downloads the employment data and processes it to a conforming form.

iotables processing functions

These are various helper functions for accessing parts of the symmetric input-output tables and joining them correctly. [conforming_vector_create](#) is a helper function that creates a named vector that conforms with the analytical objects, such as the use table, the Leontieff-matrix, etc. [household_column_get](#) returns the final household expenditure. [primary_input_get](#) will retrieve any primary input from the input-output table. [output_get](#) is a wrapper function around the [primary_input_get](#) function. [total_tax_add](#) adds taxes to an input-output table. [empty_remove](#) symmetrically removes columns and rows if they contain missing values, or each and every value is zero. [rows_add](#) Add conforming row(s) to a matrix.

analytic object functions

[input_flow_get](#) returns the use (input flow) matrix; [leontieff_matrix_create](#) and the [leontieff_inverse_create](#) to create the respective analytic matrixes.

indicator functions

[input_indicator_create](#) The function creates the input indicators from the inputs and the outputs. [direct_effects_create](#) for direct effects. [coefficient_matrix_create](#) The coefficient matrix is related by default to output, but you can change this to total supply or other total aggregate if it exists in the data table.

multiplier functions

[multiplier_create](#) is a wrapper around [equation_solve](#) to create multipliers. This is a more generic helper function to calculate various multipliers.

[input_multipliers_create](#) is a function to create input multipliers (for direct and indirect economic effects.)

linkage functions

[backward_linkages](#) creates the vector of industry (product) backward linkages in a wide data.frame class, following the column names of the Leontieff inverse matrix.

[forward_linkages](#) creates the vector of industry (product) forward linkages in a long-form data.frame, containing the metadata column of the the row names from the [output_coefficient_matrix](#).

Metadata datasets

Data files that contain descriptive metadata for a correct reproduction of the symmetric input-output tables. The analytic functions use matrix equations that require a precise column and row order for each table.

Validation datasets

Data files that replicate published input-output tables with analysis. These files are used to validate the correct working of the analytic functions.

Croatia data files

These are Croatia's symmetric input-output tables for the year 2010, when the country was not yet an EU member state.

iotables_download

Download input-output tables

Description

This function downloads standard input-output table files. Currently only Eurostat files are supported. You are not likely to use this function, because [iotable_get](#) will call this function if necessary and properly filter out an input-output table.

Usage

```
iotables_download(
  source = "naio_10_cp1700",
  data_directory = NULL,
  force_download = FALSE
)
```

Arguments

source See the available list of sources above in the Description.

data_directory Defaults to NULL, if a valid directory, it will try to save the pre-processed data file here with labelling.

force_download Defaults to FALSE which will use the existing downloaded file in the `data_directory` or the temporary directory, if it exists. TRUE will try to download the file from the Eurostat warehouse.

Details

The data is downloaded in the `tempdir()` under the name the statistical product as an rds file. (For example: `naio_10_cp1750.rds`) The temporary directory is emptied at every normal R session exit.

To save the file for further use (which is necessary in analytical work because download times are long) set the `download_directory` [see parameters]. The function will make a copy of the rds file in this directory.

- `naio_10_cp1700` Symmetric input-output table at basic prices (product by product)
- `naio_10_pyp1700` Symmetric input-output table at basic prices (product by product) (previous years prices)
- `naio_10_cp1750` Symmetric input-output table at basic prices (industry by industry)
- `naio_10_pyp1750` Symmetric input-output table at basic prices (industry by industry) (previous years prices)
- `naio_10_cp15` Supply table at basic prices incl. transformation into purchasers' prices
- `naio_10_cp16` Use table at purchasers' prices
- `naio_10_cp1610` Use table at basic prices
- `naio_10_pyp1610` Use table at basic prices (previous years prices) (`naio_10_pyp1610`)
- `naio_10_cp1620` Table of trade and transport margins at basic prices
- `naio_10_pyp1620` Table of trade and transport margins at previous years' prices
- `naio_10_cp1630` Table of taxes less subsidies on products at basic prices
- `naio_10_pyp1630` Table of taxes less subsidies on products at previous years' prices
- `uk_2010_siot` United Kingdom Input-Output Analytical Tables data

Value

A nested data frame. Each input-output table is in a separate row of the nested output, where all the metadata are in columns, and the actual, tidy, ordered input-output table is in the `data` column. The data is saved into the actual `tempdir()`, too.

See Also

Other import functions: [airpol_get\(\)](#), [employment_get\(\)](#), [iotable_get\(\)](#), [iotables_metadata_get\(\)](#), [iotables_read_tempdir\(\)](#)

Examples

```
io_tables <- iotables_download(source = "naio_10_pyp1750")
```

`iotables_metadata_get` *Get Metadata from Nested iotables File*

Description

Remove the data column and return only the metadata information of input-output (or related tables) from a source. If `dat` is not inputted as a nested data frame created by [iotables_download](#), validate the source input parameter and try to load the table from the current sessions' temporary directory.

- `naio_10_cp1700` Symmetric input-output table at basic prices (product by product)
- `naio_10_pyp1700` Symmetric input-output table at basic prices (product by product) (previous years prices)
- `naio_10_cp1750` Symmetric input-output table at basic prices (industry by industry)
- `naio_10_pyp1750` Symmetric input-output table at basic prices (industry by industry) (previous years prices)
- `naio_10_cp15` Supply table at basic prices incl. transformation into purchasers' prices
- `naio_10_cp16` Use table at purchasers' prices
- `naio_10_cp1610` Use table at basic prices
- `naio_10_pyp1610` Use table at basic prices (previous years prices) (`naio_10_pyp1610`)
- `naio_10_cp1620` Table of trade and transport margins at basic prices
- `naio_10_pyp1620` Table of trade and transport margins at previous years' prices
- `naio_10_cp1630` Table of taxes less subsidies on products at basic prices
- `naio_10_pyp1630` Table of taxes less subsidies on products at previous years' prices
- `uk_2010_siot` United Kingdom Input-Output Analytical Tables data

Usage

```
iotables_metadata_get(dat = NULL, source = "naio_10_cp1700")
```

Arguments

<code>dat</code>	A nested data file created by iotables_download . Defaults to NULL in which case an attempt is made to find and read in the nested data from the current R sessions' temporary directory.
<code>source</code>	See the available list of sources above in the Description.

Value

A data frame, which contains the metadata of all available input-output tables from a specific source.

See Also

Other import functions: [airpol_get\(\)](#), [employment_get\(\)](#), [iotable_get\(\)](#), [iotables_download\(\)](#), [iotables_read_tempdir\(\)](#)

Examples

```
# The table must be present in the sessions' temporary directory:
iotables_download(source = "naio_10_pyp1750")

# Now you can get the metadata:
iotables_metadata_get(source = "naio_10_pyp1750")
```

`iotables_read_tempdir` *Read input-output tables from temporary directory Validate the source input parameter and try to load the table from the current sessions' temporary directory.*

 - `naio_10_pyp1630` *Table of taxes less subsidies on products at previous years' prices*
 - `uk_2010_siot` *United Kingdom Input-Output Analytical Tables data*
-

Description

Read input-output tables from temporary directory

Validate the source input parameter and try to load the table from the current sessions' temporary directory.

- `naio_10_cp1700` Symmetric input-output table at basic prices (product by product)
- `naio_10_pyp1700` Symmetric input-output table at basic prices (product by product) (previous years prices)
- `naio_10_cp1750` Symmetric input-output table at basic prices (industry by industry)
- `naio_10_pyp1750` Symmetric input-output table at basic prices (industry by industry) (previous years prices)
- `naio_10_cp15` Supply table at basic prices incl. transformation into purchasers' prices
- `naio_10_cp16` Use table at purchasers' prices
- `naio_10_cp1610` Use table at basic prices
- `naio_10_pyp1610` Use table at basic prices (previous years prices) (`naio_10_pyp1610`)
- `naio_10_cp1620` Table of trade and transport margins at basic prices
- `naio_10_pyp1620` Table of trade and transport margins at previous years' prices
- `naio_10_cp1630` Table of taxes less subsidies on products at basic prices
- `naio_10_pyp1630` Table of taxes less subsidies on products at previous years' prices
- `uk_2010_siot` United Kingdom Input-Output Analytical Tables data

Usage

```
iotables_read_tempdir(source = "naio_10_cp1700")
```

Arguments

`source` See the available list of sources above in the Description. Defaults to `source = "naio_10_cp1700"`.

Value

A nested data frame. Each input-output table is in a separate row of the nested output, where all the metadata are in columns, and the actual, tidy, ordered input-output table is in the `data` column.

See Also

Other import functions: [airpol_get\(\)](#), [employment_get\(\)](#), [iotable_get\(\)](#), [iotables_download\(\)](#), [iotables_metadata_get\(\)](#)

Examples

```
# The table must be present in the sessions' temporary directory:
iotables_download(source = "naio_10_pyp1750")

iotables_read_tempdir (source = "naio_10_pyp1750")
```

iotable_get

Get an input-output table fom bulk file

Description

This function is used to filter out a single input-output table from a database, for example a raw file downloaded from the Eurostat website. It provides some functionality to avoid some pitfalls.

Usage

```
iotable_get(
  labelled_io_data = NULL,
  source = "germany_1990",
  geo = "DE",
  year = 1990,
  unit = "MIO_EUR",
  stk_flow = "DOM",
  labelling = "iotables",
  data_directory = NULL,
  force_download = TRUE
)
```

Arguments

labelled_io_data

If you have downloaded a bulk data file with [iotables_download](#), it is faster to work with the data in the memory. Defaults to NULL when the data will be retrieved from the hard disk or from the Eurostat website invoking the same function.

source

A data source, for example `naio_10_cp1700`.

- `naio_10_cp1700` Symmetric input-output table at basic prices (product by product)
- `naio_10_pyp1700` Symmetric input-output table at basic prices (product by product) (previous years prices)
- `naio_10_cp1750` Symmetric input-output table at basic prices (industry by industry)
- `naio_10_pyp1750` Symmetric input-output table at basic prices (industry by industry) (previous years prices)
- `naio_10_cp15` Supply table at basic prices incl. transformation into purchasers' prices
- `naio_10_cp16` Use table at purchasers' prices
- `naio_10_cp1610` Use table at basic prices
- `naio_10_pyp1610` Use table at basic prices (previous years prices) (`naio_10_pyp1610`)
- `naio_10_cp1620` Table of trade and transport margins at basic prices
- `naio_10_pyp1620` Table of trade and transport margins at previous years' prices
- `naio_10_cp1630` Table of taxes less subsidies on products at basic prices
- `naio_10_pyp1630` Table of taxes less subsidies on products at previous years' prices

For further information consult the [Eurostat Symmetric Input-Output Tables](#) page.

geo	A country code or a country name. For example, SK or as Slovakia.
year	A numeric variable containing the year. Defaults to 2010, because this year has the most data.
unit	A character string containing the currency unit, defaults to MIO_NAC (million national currency unit). The alternative is MIO_EUR.
stk_flow	Defaults to DOM as domestic output, alternative IMP for imports and TOTAL for total output. For source = 'naio_10_cp1620' and trade and transport margins and source = 'naio_10_cp1630' taxes less subsidies only TOTAL is not used.
labelling	Defaults to iotables which gives standard row and column names regardless of the source of the table, or if it is a product x product, industry x industry or product x industry table. The alternative is short or eurostat which is the original short row or column code of Eurostat or OECD.
data_directory	Defaults to NULL, if a valid directory, it will try to save the pre-processed data file here with labelling.
force_download	Defaults to TRUE. If FALSE it will use the existing downloaded file in the data_directory or the temporary directory, if it exists. Will force download only in a new session.

Details

Unless you want to work with bulk data files, you should not invoke [iotables_download](#) directly, rather via this function, if and when it is necessary.

Value

A wide format data.frame with a well-ordered input-output table. The bulk data files on the Eurostat website are in a long form and they are not correctly ordered for further matrix equations.

See Also

Other import functions: [airpol_get\(\)](#), [employment_get\(\)](#), [iotables_download\(\)](#), [iotables_metadata_get\(\)](#), [iotables_read_tempdir\(\)](#)

Examples

```
germany_table <- iortable_get( source = "germany_1990",
                             geo = 'DE', year = 1990, unit = "MIO_EUR",
                             labelling = "iotables" )
```

iortable_year_get	<i>Get Available Years For Input-Output Tables</i>
-------------------	--

Description

The function selects the available tables by year or time as a date for a specific country and currency unit in the Eurostat bulk file. Unless you want to work with bulk data files, you should not invoke [iotables_download](#) directly, rather via this function, if and when it is necessary.

Usage

```
iotable_year_get(
  labelled_io_data = NULL,
  source = "germany_1990",
  geo = "DE",
  unit = "MIO_EUR",
  time_unit = "year",
  stk_flow = "TOTAL",
  data_directory = NULL,
  force_download = TRUE
)
```

Arguments

labelled_io_data	If you have downloaded a bulk data file with iotables_download , it is faster to work with the data in the memory. Defaults to NULL when the data will be retrieved from the hard disk or from the Eurostat website invoking the same function.
source	A data source, for example <code>naio_10_cp1700</code> . Symmetric input-output table at basic prices (product by product) (<code>naio_10_cp1700</code>) Symmetric input-output table at basic prices (industry by industry) (<code>naio_10_cp1750</code>) Symmetric input-output table at basic prices (product by product) (previous years prices) (<code>naio_10_pyp1700</code>) Symmetric input-output table at basic prices (industry by industry) (previous years prices) (<code>naio_10_pyp1750</code>) Table of trade and transport margins at basic prices (<code>naio_10_cp1620</code>) and at previous' years prices (<code>naio_10_pyp1620</code>) Table of taxes less subsidies on products at basic prices (<code>naio_10_cp1630</code>) and at previous' years prices (<code>naio_10_pyp1630</code>) For further information consult the Eurostat Symmetric Input-Output Tables page.
geo	A country code or a country name. For example, SK or as Slovakia.
unit	A character string containing the currency unit, defaults to MIO_NAC (million national currency unit). The alternative is MIO_EUR.
time_unit	Defaults to 'year' and years are returned as numbers. Alternative is to return 'time' as vector of dates.
stk_flow	Defaults to DOM as domestic output, alternative IMP for imports and TOTAL for total output. For <code>source = 'naio_10_cp1620'</code> and trade and transport margins and <code>source = 'naio_10_cp1630'</code> taxes less subsidies only TOTAL is not used.
data_directory	Defaults to NULL. Use if it you used a <code>data_directory</code> parameter with iotable_get or iotables_download .
force_download	Defaults to TRUE. If FALSE it will use the existing downloaded file in the <code>data_directory</code> or the temporary directory, if it exists. Will force download only in a new session.

Value

A vector with the years that have available input-output tables.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
germany_years <- iotable_year_get ( source = "germany_1990", geo = 'DE',
                                   unit = "MIO_EUR" )
```

is_html_output	<i>Check if HTML output is required</i>
----------------	---

Description

Check if HTML output is required

is_latex_output	<i>Check if Latex output is required</i>
-----------------	--

Description

Check if Latex output is required

key_column_create	<i>Create a key column</i>
-------------------	----------------------------

Description

Create a key column for matching dimensions of matrixes.

Usage

```
key_column_create(key_column_name, key_column_values = NULL)
```

Arguments

key_column_name	The name of the key column.
key_column_values	The value(s) of the key column

Details

This function will likely be used with the creation of coefficients that need to be matched with a matrix that has a key column.

Value

A tibble with one column, named key_column_name and with values key_column_values.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
key_column_create ("iotables_row", c("CO2_multiplier", "CH4_multiplier"))
```

leontieff_inverse_create

Create the inverse of a Leontieff-matrix.

Description

The inversion takes place after the basic properties of the Leontieff matrix.

Usage

```
leontieff_inverse_create(technology_coefficients_matrix, digits = NULL)
```

Arguments

technology_coefficients_matrix

A technology coefficient matrix created by the [input_coefficient_matrix_create](#) or [output_coefficient_matrix_create](#).

digits

An integer showing the precision of the technology matrix in digits. Default is NULL when no rounding is applied.

See Also

Other analytic object functions: [input_flow_get\(\)](#), [leontieff_matrix_create\(\)](#)

Examples

```
tm <- input_flow_get (
  data_table = iotable_get(),
  households = FALSE)
I <- leontieff_inverse_create( technology_coefficients_matrix = tm )
```

 leontieff_matrix_create

Create a Leontieff matrix

Description

Create a Leontieff matrix from technology matrix after some basic error handling. Most likely you will need this function as a step to invoke the function to create its inverse: [leontieff_inverse_create](#).

Usage

```
leontieff_matrix_create(technology_coefficients_matrix)
```

Arguments

technology_coefficients_matrix

A technology coefficient matrix created by the [input_coefficient_matrix_create](#) or [output_coefficient_matrix_create](#).

Value

A Leontieff matrix of data.frame class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

See Also

Other analytic object functions: [input_flow_get\(\)](#), [leontieff_inverse_create\(\)](#)

Examples

```
tm <- input_flow_get (
  data_table = iotable_get(),
  households = FALSE)
L <- leontieff_matrix_create( technology_coefficients_matrix = tm )
```

 matrix_round

Round all matrix values to required number of digits.

Description

For comparison with results created with other software or published with rounding, systematically round the values of an input-output table, a use, supply, tax or margins table.

Usage

```
matrix_round(data_table, digits = 0)
```

Arguments

data_table

A symmetric input output table, a use, supply, tax or margins table.

digits

An integer number, defaults to 0.

Value

The matrix, with the intact key column and the numeric columns rounded.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

metadata	<i>Metadata</i>
----------	-----------------

Description

An arrangement of the Eurostat national accounts vocabulary, used to correctly order wide format rows and columns from bulk long-form tables.

Usage

```
data(metadata)
```

Format

A data frame with 8 variables.

variable Eurostat vocabulary source, i.e. t_rows, t_cols, prod_na, induse

group Informal labelling for macroeconomic groups

code Eurostat labels

label Eurostat label descriptions

quadrant Where to place the data from a long-form raw data file

account_group Different from Eurostat tables, in thousand national currency units.

numeric_label ordering from quadrant, account_group, digit_1, digit_2

iotables_label Custom, machine_readable snake format variable names

See Also

Other Metadata datasets: [employment_metadata](#), [metadata_uk_2010](#)

metadata_uk_2010	<i>Multipliers and effects (product) for testing from the United Kingdom Input-Output Analytical Tables, 2010</i>
------------------	---

Description

The Excel-imported UK data.

Usage

```
data(uk_2010_data)
```

Format

A data frame with 10 variables.

variable Constant for the `iotable_get` function.

uk_row The UK row identifier. Dots and '&' converted to '-'.
uk_col The UK row identifier. Dots and '&' converted to '-'.
uk_row_label The original UK row labels.
uk_col_label The original UK column labels.
eu_prod_na The Eurostat vocabulary equivalent of `uk_row`
row_order Ordering variable for rows.
col_order Ordering variable for columns.
prod_na The Eurostat-like key values for rows.
induse The Eurostat-like column names

multiplier_create	<i>Create multipliers</i>
-------------------	---------------------------

Description

This function is in fact a wrapper around the `equation_solve` function, adding a key column with the name to the multiplier to maintain structural consistency.

Usage

```
multiplier_create(  
  input_vector,  
  Im,  
  multiplier_name = "multiplier",  
  digits = NULL  
)
```

Arguments

<code>input_vector</code>	An input matrix or vector created by the input_indicator_create function.
<code>Im</code>	The Leontieff inverse as a named object created by the leontieff_inverse_create function.
<code>multiplier_name</code>	A variable name to be given to the returned multipliers. Defaults to <code>multiplier</code> .
<code>digits</code>	Rounding digits, if omitted, no rounding takes place.

Details

As opposed to direct effects, multipliers are expressed per input of product/industry.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other multiplier functions: [input_multipliers_create\(\)](#)

Examples

```
data_table <- iotable_get()

coeff_de <- input_coefficient_matrix_create( data_table )

de_gva_indicator <- input_indicator_create (
  data_table = data_table,
  input = 'gva') #this is a correct input

I_de <- leontieff_inverse_create( coeff_de )

de_gva_multipliers <- multiplier_create (
  input_vector = de_gva_indicator,
  Im = I_de,
  multiplier_name = "employment_multiplier",
  digits = 4 )
```

netherlands_2006

Simple input-output table for the Netherlands, 2006.

Description

This simplified SIOT is taken from the Science Policy Integration for Coastal Systems Assessment project's input-output multiplier specification sheet. It is used as a simple example SIOT for controlled analytical results. The column names were slightly altered to resemble more the current Eurostat conventions and the main example dataset [germany_1990](#).

Usage

```
data(netherlands_2006)
```

Format

A data frame with 14 observations and 13 variables.

A data frame of 13 observations in 14 variables.

prod_na Product name, simplified, following the Eurostat conventions

agriculture_group Simple aggregated agricultural products

mining_group Simple aggregated mining products

manufacturing_group Simple aggregated manufacturing products

construction_group Construction

utilities_group Simple aggregated utilities products/services

services_group Simple aggregated services products

TOTAL Column / row sums, simple summary, not included in the original source

final_consumption_private Simple aggregated final private use

final_consumption_households Simple aggregated final household consumption

final_consumption_government Simple aggregated final government consumption

gross_fixed_capital_formation Gross fixed capital formation 'GFCF'

exports Simple aggregated exports

total_use Simple aggregated total use

output_coefficients_create

Create output coefficients

Description

Create coefficients from supplementary data.

Usage

```
output_coefficients_create(data_table, output)
```

Arguments

data_table A matrix or vector that should have a key column.

output An output vector created with `output_get`.

Examples

```
emissions_de <- germany_airpol[, -3]
emissions_de <- vector_transpose_wider( names_from = "iotables_col", values_from = "value")
output_bp <- output_get (iotable_get())
output_coefficients_create (emissions_de, output_bp)
```

```
output_coefficient_matrix_create
```

Create an output coefficient matrix

Description

Create an output coefficient matrix from the input flow matrix or a symmetric input-output table.

Usage

```
output_coefficient_matrix_create(io_table, total = "tfu", digits = NULL)
```

Arguments

<code>io_table</code>	A symmetric input-output table or use table created with the <code>iotable_get</code> function which contains the 'total' column. In case you use <code>type="tfu"</code> you need to input a full iotable, create by the <code>iotable_get</code> , because you will need the final demand column.
<code>total</code>	The <code>output='total'</code> (or <code>CPA_TOTAL</code> , depending on the names in your table, default) returns the output coefficients for products (intermediates) while the <code>final_demand</code> returns output coefficients for final demand. See Eurostat Manual, p495 and p507.
<code>digits</code>	An integer showing the precision of the technology matrix in digits. Default is <code>NULL</code> when no rounding is applied.

Details

If there are zero values in present, they will be changed to 0.000001 and you will get a warning. Some analytical equations cannot be solved with zero elements. You either have faulty input data, or you have to use some sort of data modification to carry on your analysis.

Value

An output coefficient matrix of `data.frame` class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

Examples

```
io_table <- iotable_get()

output_coefficient_matrix_create (io_table = io_table,
                                 total = 'tfu',
                                 digits = 4)
```

output_get *Get an output vector*

Description

This is a wrapper function around the [primary_input_get](#) function.

Usage

```
output_get(data_table)
```

Arguments

data_table A symmetric input-output table or use table retrieved by the [iotable_get](#) function.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
output_get ( data_table = iotable_get () )
```

output_multiplier_create
Create output multipliers

Description

Create a data frame of output multipliers.

Usage

```
output_multiplier_create(input_coefficient_matrix)
```

Arguments

input_coefficient_matrix
A Leontieff inverse matrix created by the [input_coefficient_matrix_create](#) function.

Details

Output multipliers as defined by the Eurostat Manual of Supply, Use and Input-Output Tables on p500.

Value

A data frame with a key column and the output multipliers of the industries.

Examples

```
de_input_coeff <- input_coefficient_matrix_create(  
  iotable_get(),  
  digits = 4)  
  
output_multiplier_create (de_input_coeff)
```

primary_inputs	<i>Primary input abbreviations</i>
----------------	------------------------------------

Description

Only currently used primary inputs. Abbreviations for filtering.

Usage

```
data("croatia_employment_aggregation")
```

Format

A data frame with 105 rows (including empty ones) and 2 variables.

t_rows2 Eurostat code of the input.

t_rows2_lab Labelling of the input by Eurostat.

source Eurostat / DZS

indicator Human readable abbreviation

See Also

Other Croatia 2010 datasets: [croatia_2010_1700](#), [croatia_2010_1800](#), [croatia_2010_1900](#), [croatia_employment_2013](#), [croatia_employment_aggregation](#)

primary_input_get	<i>Get primary inputs This function will retrieve any primary input from the input-output table.</i>
-------------------	--

Description

Get primary inputs

This function will retrieve any primary input from the input-output table.

Usage

```
primary_input_get(data_table, primary_input = "compensation_employees")
```

Arguments

data_table A symmetric input-output table, a use table, or a supply table retrieved by the [iotable_get](#) function.

primary_input The primary input to be returned from the table.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
comp_employees_de <- primary_input_get(
  data_table = iotable_get(),
  primary_input = "compensation_employees")
```

rows_add	<i>Add conforming row(s)</i>
----------	------------------------------

Description

Add a conforming row, or elements of a conforming row to a names matrix.

Usage

```
rows_add(data_table, rows_to_add, row_names = NULL, empty_fill = 0)
```

Arguments

data_table	A symmetric input-output table, a use table, a margins or tax table retrieved by the <code>iotable_get</code> function.
rows_to_add	A data frame or a named numeric vector.
row_names	An optional name or vector of names for the key column. Defaults to NULL.
empty_to_fill	What should happen with missing column values? Defaults to 0. If you want to avoid division by zero, you may consider a very small value such as 0.000001.

Details

If you want to add a single row manually, you can input a named numeric vector or a data frame with a single row. For multiple rows, input them as wide form data frame (see examples.)

Value

An extended data_table with the new row(s) binded.

See Also

Other iotables processing functions: `conforming_vector_create()`, `household_column_get()`, `iotable_year_get()`, `key_column_create()`, `matrix_round()`, `output_get()`, `primary_input_get()`, `supplementary_add()`, `total_tax_add()`, `vector_transpose_longer()`, `vector_transpose_wider()`

Examples

```
rows_to_add <- data.frame ( iotables_row      = "CO2_emission",
                          agriculture_group = 10448,
                          industry_group   = 558327, #construction is omitted
                          trade_group      = 11194)

rows_add (iotable_get(), rows_to_add = rows_to_add)

rows_add (iotable_get(),
          rows_to_add = c(industry_group = 1534,
                          trade_group   = 4),
          row_names   = "CH4_emission" )
```

supplementary_add *Add Supplementary Data*

Description

Add supplementary data to a SIOT, a use, supply or margins table.

Usage

```
supplementary_add(data_table, supplementary_data, supplementary_names = NULL)
```

Arguments

- `data_table` A SIOT, a use table, a supply table, or a margins table.
- `supplementary_data` Supplementary data to be added. It must be a data.frame or tibble with a key column containing the indicator's name, and the column names must match with the `data_table`. Can be a vector or a data frame of several rows.
- `supplementary_names` Optional names for the new supplementary rows. Defaults to NULL.
- `empty_to_fill` What should happen with missing column values? Defaults to 0. If you want to avoid division by zero, you may consider a very small value such as 0.000001.

Details

This function is a wrapper around the more general [rows_add](#) function.

Value

An extended `data_table` with the new row(s) binded.

A symmetric input-output table with supplementary data, of data.frame class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
de_io <- iotable_get()
CO2_coefficients <- data.frame(agriculture_group = 0.2379,
                              industry_group   = 0.5172,
                              construction     = 0.0456,
                              trade_group      = 0.1320,
                              business_services_group = 0.0127,
                              other_services_group = 0.0530)
CH4_coefficients <- data.frame(agriculture_group = 0.0349,
                              industry_group   = 0.0011,
                              construction     = 0,
                              trade_group      = 0,
                              business_services_group = 0,
                              other_services_group = 0.0021)
CO2 <- cbind (data.frame(iotables_row = "CO2"),
              CO2_coefficients)
CH4 <- cbind(data.frame (iotables_row = "CH4_coefficients"),
              CH4_coefficients)
de_coeff <- input_coefficient_matrix_create ( iotable_get() )
emissions <- rbind (CO2, CH4)

# Check with the Eurostat Manual page 494:
supplementary_add(de_io, emissions)
```

total_tax_add	<i>Summarize and add tax data</i>
---------------	-----------------------------------

Description

Create and add a total tax row, if there are multiple tax rows present in the `data_table`.

Usage

```
total_tax_add(
  data_table,
  tax_names = c("d21x31", "d29x39"),
  total_tax_name = "TOTAL_TAX"
)
```

Arguments

`data_table` A SIOT, a use table, a supply table, or a margins table that has product and production tax rows in among the primary inputs.

`tax_names` Defaults to ("d21x31", "d29x39"), which are the Eurostat names for taxes. The parameter is not case sensitive.

`total_tax_name` Defaults to 'TOTAL_TAX'. The name of the summarized row. It is case sensitive.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [vector_transpose_longer\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
de_io <- iotable_get()

total_tax_add (de_io,
  tax_names = c("net_tax_products", "net_tax_production"),
  total_tax_name = "total_tax")
```

 uk_2010_data

United Kingdom Input-Output Analytical Tables, 2010

Description

The Excel-imported UK data.

Usage

```
data(uk_2010_data)
```

Format

A data frame with 10 variables.

uk_row The UK row identifier. Dots and '&' converted to '-'.
uk_row_lab The original UK row labels.

uk_col The UK row identifier. Dots and '&' converted to '-'.
uk_col_lab The original UK column labels.

geo Eurostat-style geocode, i.e. UK

geo_lab United Kingdom

indicator The name of the indicator, i.e. Excel sheet.

unit Eurostat label equivalents units, i.e. MIO_NAC.

unit_lab Eurostat label equivalents, i.e. millions of national currency unit.

values The numeric values of the variable

year Constant = 2010.

 uk_2010_results_get

Get United Kingdom Multipliers and Effects, 2010

Description

This function will retrieve the published effects and multipliers from the United Kingdom Input-Output Analytical Tables, 2010 (consistent with UK National Accounts Blue Book 2013 & UK Balance of Payments Pink Book 2013) by Richard Wild.

Usage

```
uk_2010_results_get(path = NULL)
```

Arguments

path A path to the downloaded file, if already exists, given with `file.path()` function.

Source

[ukioanalyticaltablesio1062010detailedpubversion.xls](#)

Examples

```
## Not run:
uk_results <- iotables::uk_2010_results_get ()

## End(Not run)
```

uk_test_results	<i>Multipliers and effects (product) for testing from the United Kingdom Input-Output Analytical Tables, 2010</i>
-----------------	---

Description

The Excel-imported UK data.

Usage

```
data(uk_test_results)
```

Format

A data frame with 12 variables.

uk_row_label The UK row label

Output multiplier The imported Output multipliers

output_multiplier_rank The imported ranking of output multipliers

Employment cost multiplier The imported Employment cost multipliers.

employment_cost_multiplier The imported ranking of Employment cost multipliers.

Employment cost effects The imported Employment cost multipliers.

employment_cost_effects_rank The imported ranking of employment cost multipliers.

GVA effects The imported GVA effects.

gva_effects_rank The imported ranking GVA effects.

gva_multiplier_rank The imported ranking GVA multipliers.

GVA multiplier The imported GVA multipliers.

indicator Indicator names.

`vector_transpose_longer`*Transpose a vector to a long form*

Description

Many vectors (indicators, multipliers) are create in the wide form to conform matrixes in analytical functions. For printing it is more useful to have them in long form.

Usage

```
vector_transpose_longer(  
  data_table,  
  names_to = "nace_r2",  
  values_to = "value",  
  key_column_name = NULL,  
  .keep = FALSE  
)
```

```
vector_transpose(  
  data_table,  
  names_to = "nace_r2",  
  values_to = "value",  
  key_column_name = NULL,  
  .keep = FALSE  
)
```

Arguments

<code>data_table</code>	A matrix or vector that should have a key column.
<code>names_to</code>	Defaults to 'nace_r2'.
<code>values_to</code>	Defaults to 'value'.
<code>.keep</code>	Keep the indicator identifier column? Defaults to FALSE.

Details

This is a wrapper around [pivot_longer](#) so you do not necessarily need to import or load the entire *tidyr* package.

Value

A long form vector with a key column, and optionally the identifier of the indicator in the first column.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_wider\(\)](#)

Examples

```
vector_transpose_longer(
  data.frame(indicator = "my_inidicator",
             agriculture = 0.0123,
             manufacturing = 0.1436,
             trade = 0.0921)
)
```

```
vector_transpose_wider
```

Transpose a vector to wider format

Description

Many vectors (indicators, multipliers) are create in the wide form to conform matrixes in analytical functions. For binding it is more useful to have them in wide format.

Usage

```
vector_transpose_wider(
  data_table,
  names_from,
  values_from,
  key_column_name = NULL,
  key_column_values = NULL
)
```

Arguments

`key_column_name`
The name of the key column.

`key_column_values`
The value(s) of the key column

Details

This is a wrapper around [pivot_wider](#) so you do not necessarily need to import or load the entire *tidyr* package.

See Also

Other iotables processing functions: [conforming_vector_create\(\)](#), [household_column_get\(\)](#), [iotable_year_get\(\)](#), [key_column_create\(\)](#), [matrix_round\(\)](#), [output_get\(\)](#), [primary_input_get\(\)](#), [rows_add\(\)](#), [supplementary_add\(\)](#), [total_tax_add\(\)](#), [vector_transpose_longer\(\)](#)

Examples

```
vector_transpose_wider (data_table = germany_airpol[, -2],
                       names_from = 'induse',
                       values_from = 'value')
```

```
vector_transpose_wider (data_table = germany_airpol[1:8, 3:4],
```

```
names_from = 'induse',  
values_from = 'value',  
key_column_values = "CO2_emission" )
```
